

Jeep Liberty Retrofit Headlights

Package Includes

2x Headlights
2x HID 6000k Bulbs
2x HID 35watt Ballasts
1 HID Harness w/ Relay

Installation Quick FAQs

These headlights are intended for off-road / car show use only.

Tools needed will be a wire cutter or splicer / black electrical tape / test light / and patience. IF done correctly with basic knowledge of your jeep. You will have headlights within 20-30 min.

Installation is not hard, but you will take some time, and you will need to know the basics of how your Jeep Liberty works to get everything wired up directly. Don't forget to install the HID harness so you can use the HID kit supplied and have low beam and high beam functions.

Unscrew your bumper marker lamps, because you will need to tap into the positive and negative of the harness. Look for the positive parking lamp wire and tap the red (or blue) wire. And then do the same with the black (or white) wire for the negative. Double check you have not tapped into the blinker line of the harness or your halos will blink. This will cause the halos to short out and cut its life span.

Make sure you have securely tightened the the lines you have tapped into. And make sure you have securely the HID ballasts correctly so they do not move around when you drive, or send it thru the woods or mud.

And very last enjoy. It has a been a pleasure to create these lights for you and it is a honor to have you representing the C4 Nation with the V Headlights. If you have any questions, don't hesitate to email or Facebook message me. I am always here to help.
